Release 26.04.106 Notes

Test Release Date: Apr 10th, 2026, **Production Release Date:** Apr 24th 2026

Agent Update

None

Introduction

EPMware Release 26.04.106

This is a minor release containing new features and enhancements to existing features, and API additions. The features of this release were developed to enhance the design capabilities, performance, and improve ease of use of applications. System administrators and users will benefit from the enhancements across their application.

Bug Fixes

EW-2479 – Property Assignment Issue for Dimension-Specific Categories

Description:

Properties can be assigned either at the **dimension class level (all dimensions)** or to a **specific dimension**.

When assigning properties to a **property category configured for a specific dimension**, properties assigned to “**All Dimensions**” were not displayed.

Expected Behavior:

- **Category = All Dimensions** → Show all properties
- **Category = Specific Dimension** → Show:
 - Properties assigned to all dimensions
 - Properties assigned to that specific dimension
 - Exclude properties assigned to other specific dimensions

This issue has been corrected.

EW-2521 – ORA Error During Export with Mixed Shared and Primary Configurations

Description:

An ORA error occurred when an export included **multiple export detail records** for the same dimension with conflicting configurations for **Shared Members**.

Scenario:

- One export detail includes shared members
- Another excludes shared members
- Both reference different top members

Fix:

Export logic has been updated to correctly handle mixed configurations.

EW-2525 – Bulk Upload Validation Errors for Reorder Action with Shared Members

Description:

Bulk Upload incorrectly threw validation errors when reordering child members that included **shared instances**.

This restriction has been removed, and reordering now supports shared members correctly.

EW-2527 – Multiple Shared Member Move Issues

Description:

When moving multiple shared members using **Paste as Child**:

- Only the first member was placed correctly
- Subsequent members were placed incorrectly or caused errors
- In some cases, the error “**Hierarchy ID passed is NULL**” was thrown

This issue has been resolved.

New Features

EW-2393 – Updated Help Links to MKDocs Documentation

Description:

All Help lookup links have been updated to point to the new **MKDocs-based documentation URLs**.

Improvements

EW-2389 – Selective Deletion of Request Lines

Description:

Users can now delete **multiple selected request lines** instead of only deleting one line at a time or all lines.

This significantly improves usability for large requests (e.g., thousands of lines).

EW-2440 – Show Application Import Files in Configuration Screen

Description:

Added functionality to display files used during **Application Import** in the Application Configuration screen.

Details:

- Displays files from `EW_FILES_ARCHIVE`
 - Sorted by **FILE_ID (descending)**
 - Columns include:
 - ID
 - Import Date
 - File Name (clickable for download)
-

EW-2501 – PBCS Deployment Admin Mode Support

Description:

Added a new Application Property:

PBCS_DEPLOY_ADMIN_MODE (Default = N)

When enabled:

- PBCS application is switched to **Admin Mode** before deployment
- All non-admin users are logged out
- After deployment (success or failure), the system is returned to **All Users mode**

This ensures consistency during metadata deployments.

EW-2502 – Default Scenario and Time Values for OneStream Member Formula

Description:

When clearing a member formula in OneStream, the system previously allowed saving without selecting a **Scenario**, leading to invalid states.

Fix:

The system now enforces valid Scenario selection or assigns a default value automatically.

EW-2519 – New API to Update Multiple Member Properties

Description:

Added a new API in the `EW_REQ_API` package to update multiple properties in a single call, improving performance.

Key Feature:

- Accepts a list of property-value pairs
- Option to create request lines only when values change

EW-2520 – Support Member Names Matching Dimension Names (OneStream)

Description:

Users can now create members with the **same name as the dimension**, which is supported by OneStream but was previously restricted in EPMware.

EW-2522 – Member Description Not Displayed in Metadata Explorer Search

Description:

Fixed an issue where member descriptions were not shown when searching by **property values** in the Metadata Explorer.

EW-2524 – Configurable Execution Timing for Post Hierarchy Action Logic Scripts

Description:

Added a new configuration option:

- **Label:** Execute After Dimension Mapping
- **Type:** Checkbox
- **Default:** N

This allows users to control whether **Post Hierarchy Action Logic Scripts** execute:

- Immediately after the action, or
- After **Dimension Mapping** is completed

This improves automation scenarios involving dependent applications.

EW-2526 – Performance Improvement for OneStream Application Import

Description:

Improved performance of **Application Import** for OneStream applications, particularly for large metadata volumes and repeated import cycles.

EW-2528 – HFM Security Class Deployment File Extension Fix

Description:

Updated deployment logic to use the correct **.sec file extension** for HFM Security Class deployments (required for version 11.2 and later).

This ensures successful deployment of security class metadata.

EW-2516 – Allow Member Creation Under Root Node in Extended Dimensions

Description:

Previously, creating a member directly under the **root node** in an **extended dimension** caused deployment failures.

This issue has been resolved, and member creation under the root node is now supported.
