Release 25.02.92 Notes

Test Release Date: Feb 14th, 2025, **Production Release Date:** Feb 28, 2025

Agent Update

None

Introduction

EPMware Release 25.02.92

This is a minor release containing new features and enhancements to existing features, and API additions. The features of this release were developed to enhance the design capabilities, performance, and improve ease of use of applications. System administrators and users will benefit from the enhancements across their application.

Improvement

EW-2113 Add Filters in Export Book configuration page

Description

Add filters by Book Name

EW-2138 ERP Import Filter for Name should take * as Wildcard

Description

We consider * as wildcard character at many places like Script filter etc. But in some instances it is taken as a literal character. For example, ERP Import Filter for Name.

If you search using * then it does not work. If you remove * then it applies search.

We need to convert * as % (Oracle uses % as wildcard).

For example, searching ERP Import Profiles that begin with ASO* does not work.

You have to remove * and search using ASO to make it work.

Hencem it is not consistent.

EW-2151 Bulk Upload popup changes in the Request page

Description

If user hits the Cancel button, ask for confirmation and then cancel the Bulk Upload Transaction completely.

(To clear the bulk upload either use procedure given OR remove value of BULK_UPLOAD_ID column from the EW_REQUEST_HEADERS table)

EW-2198 Second tab is does not have a box layout, works for only first tab

Description

Only first tab shows box layout but later tabs is not showing the same.

EW-2202 In Request Page, Request Header Actions LOV takes long time or sometimes times out for ultra large requests (> 50K lines)

Description

If request has > 50K Lines and it is in approval stage then request header action LOV does not finish calculation of what options to show in that LOV on a timely manner and hence web page times it out.

EW-2207 Create a Global Setting to limit file upload limit across modules

Description

This new Global Setting will be applied across all modules and set upper limit. Lower limits can be set per module such as Attachment file size on Request page.

Setting Label : Maximum file size in MB for All Uploads

Default Value : 300 MB

Setting Code : GLOBAL_MAX_FILE_SIZE

API to get value for this setting is

`ew_settings.get_app_value('GLOBAL_MAX_FILE_SIZE')`

EW-2209 ERP Import - Remove trailing and leading spaces from values

Description

If there are leading or trailing spaces in columns such as member names, parent member names etc. then it causes ERP Import to fail. We need to remove all trailing or leading spaces for all

columns.

EW-2210 Add parameter in the Synchronize Hierarchies Report to exclude or include Reorder Action differences between source and target dimensions

Description

Add new parameter called "Exclude Reorder Action" in the Synchronize hierarchies report. This option will allow report to avoid calculating order of nodes within a parent as sometimes it is not required to be calculated. This process is very time consuming if the dimension is very large and order of child nodes is not that important for the application.

EW-2214 Add Workflow Parameter in the Request Activity Log Report

Description

Added ability to filter requests by workflow

EW-2219 Improve Performance of Audit Report - Hierarchies with Generations for Large Dimensions

Description

If dimension has > 100K nodes then Hierarchies with Generations report is taking lots of time. After tuning the report it is taking now few minutes.

Bug Fixes

EW-2173 Logic Script - Created By User Id is changed when user is updating existing logic script

Description

Instead of updating only Last_updated_by and Last_update_date it seems we are also updating Created_by column in the Logic Script screen whenever we are updating existing Logic Script.

EW-2191 In Migration module if there are no objects under a specific branch (such as ERP Import) then expanding it shows spinner

Description

In Migration module (Export) if there are no objects under a specific branch (such as ERP Import) then expanding it shows spinner which does not go away. Proper Message is shown though.

EW-2196 In Bulk Upload creating multiple requests for the same new member should use Action code Edit for the subsequent requests rather than Create Member action as provided in the file to avoid processing errors.

Description

This happens only if you use Bulk Upload to create new members.

1> Create new member using bulk upload

2> Using same bulk upload file create new request. Second request will also show new members with the "Create Member" action and this is root cause of the bug.

3> Deploy first request and complete it.

4> Delete Second request which also has "Create Member" action. By deleting this request we lose members in EPMWARE!

Fix: Second request should detect member already exists in the first bulk upload and either throw ERROR or convert it into Edit action automatically.

EW-2199 In Export module Hierarchy Type Properties in Logic Script API passed value of the Primary instance rather than separate value for Shared instances

Description

Create an Export and apply Pre Export Logic script to filter records depending on a property that is Hierarchy Type. For example, Data Storage property in ASO apps. FYI: Data Storage for all shared instances is "Shared". If script uses this condition then we should expect only Shared instances in the Export.

Current API "get_member_prop_value" does not differentiate property being hierarchy type and hence logic script fails to provide correct results in the export file.

EW-2200 Bulk Upload ignores processing property values provided in the file in a special case where the property is configured as a Readonly property and also has Property Derivation Logic Script assigned to it.

Description

Test case.

1> Create a property which is flagged as Readonly and also has a property derivation logic script applied to it.

2> Create request for new members with the file that has this property in it. (Even though not required as values are derived for this property users may still pass a value in the file).

3> Ensure whatever value is passed in the file gets assigned to the new member.

EW-2201 ERP Import creates duplicate requests in certain cases

Description

Node is created but one of the prop validation failed and hence system created another request subsequently.

EW-2204 Show Member Properties in the Hierarchies with Properties Report from Parent Dimension for Extended dimensions

Description

For OneStream apps if the user selects and Extended dimension in the Hierarchies with Properties Report then currently members from the parent dimensions are shown but none of its properties are shown.

EW-2206 Cloning Exports (Save as Export) shows Compress File checkbox enabled even though source export has it disabled.

Description

Select any export which has “Compress File” checkbox disabled and using “Save As” functionality try to clone it. New Export Popup shows “Compress File” checkbox has an Enabled checkbox even though source export has it disabled.

EW-2211 Bulk upload throws validation errors for new member lines if the order of lines in the file is not in perfect order - (Child members precedes new Parent member lines)

Description

Create a Bulk upload file where child members are being specified before its parent members which are also new members.

It currently throws validation errors rather than smartly processing them.

EW-2212 Cloning member does not copy all properties from the source member

EW-2220 Global settings -> UDF, Update was not showing success msg

Description

On Global settings -> UDF

If you update any field, it was not showing success/error.

Record was updated but was not showing operation status. In PUT method if you return null, It goes to error callback on frontend.
