Release 26.02.104 Notes

Test Release Date: Feb 13th, 2026, **Production Release Date:** Feb 27th 2026

Agent Update

A OneStream Agent update is required for OneStream Version 9 users.

Introduction

EPMware Release 26.02.104

This is a minor release containing new features and enhancements to existing features, and API additions. The features of this release were developed to enhance the design capabilities, performance, and improve ease of use of applications. System administrators and users will benefit from the enhancements across their application.

Bug Fixes

EW-2441 – Deployment Manager Update Error When Environment Assigned

Description:

Updating a Deployment Manager configured with **Request-based deployment** and an assigned environment caused the following Apache log error:

JSON parse error: Cannot deserialize value of type java.lang.Long from String "UAT"

This issue has been fixed by correcting environment value handling during Deployment Manager updates.

EW-2442 – Migration Module Large File Download Failure

Description:

Downloading very large files (e.g., 2 GB) from the Migration Module resulted in the error:

No space left on device

Fix: Large files are now automatically compressed (zipped) before download to prevent memory and disk space limitations.

EW-2445 – Essbase BSO Deployment Failure with Label Only Parent and Dynamic Calc Children

Description:

Essbase API previously attempted cube restructuring before the full hierarchy was created, resulting in validation errors.

Scenario:

- Parent member with **Label Only** data storage.
- Multiple child members with **Dynamic Calc** data storage and formulas.

Fix: Deployment logic now ensures the complete hierarchy is built before triggering cube restructure.

EW-2446 – LAST_UPDATE_DATE Not Updated in Agent Queue for PBCS Deployments

Description:

The LAST_UPDATE_DATE field in the Agent Queue table was not updated for successful or failed deployment records. This has been corrected.

EW-2449 – Weekly Deployment Schedule Not Processing Requests

Description:

Deployment Managers configured with weekly schedules failed to process queued requests correctly.

Fix: Scheduled deployments now correctly process requests at the specified scheduled time.

EW-2450 – Native User Lockout Not Cleared After Password Reset

Description:

Two issues were resolved:

1. Password reset by an administrator now immediately clears the lockout.
2. Incorrect lockout timer display (showing excessive wait times due to time zone differences) has been corrected.

EW-2451 – Migration Export Screen Loses Object Selections

Description:

After submitting an export, the Migration Module refreshed and cleared all selected objects.

Fix: Selections are now retained after export, allowing users to retry migrations without reselecting objects.

EW-2456 – File-Based Deployments Not Marked Completed

Description:

Requests containing both direct and file-based deployments were not correctly marked as completed.

Fix:

File-based deployments are now properly marked as completed after successful execution.

EW-2457 – ORA Errors in Hierarchy Reports

Description:

The following reports generated ORA errors due to duplicate column configurations:

- Hierarchies with Generations
- Generations and Levels

This has been corrected.

EW-2458 – Migration Failures for Large Metadata Exports

Description:

Migration Export/Import failed with:

ORA-27163: out of memory

Cause:

High memory usage during XML processing for large metadata exports.

Fix:

Migration module improvements reduce memory consumption.

Important Requirement:

Source and Target environments must be on the **same EPMware release version** when performing metadata migration.

EW-2459 – Compare Hierarchies Report Missing Results**Description:**

When Source and Target Top Member Names differed (e.g., “Employees” vs “EMPLOYEE”), descendant comparisons were excluded.

Fix: The report now correctly compares descendant members even when Top Member Names differ.

Improvements

EW-333 – Upgrade Impact Notice – OneStream Version 9.x Support**Description:**

EPMware now supports **OneStream Application Version 9.x**. Customers upgrading to OneStream 9.x must complete the following steps to ensure compatibility with EPMware.

Required Actions:

1. **Request Updated DLL:**
Customers must open a Support ticket with EPMware to obtain the updated OneStream integration DLL required for version 9.x compatibility.
2. **New Alias Property:**
OneStream version 9.x introduces a new property called “**Alias**”, which is a text-type property. EPMware will add this property automatically to existing OneStream applications configured in EPMware.
3. **Populating the Alias Property:**
If customers choose to populate the new Alias property, they may do so using any of the following methods:
 - Update the property directly within EPMware
 - Use the **Application Import** feature
 - Use the **Bulk Upload** feature

These options allow customers to synchronize Alias property values between OneStream and EPMware.

EW-2444 – New Deployment Configuration Report

Added a new report under the Deployment Report Group to display Deployment Configuration details.

EW-2447 – Agent Processing Performance Improvements

Description:

Agent processing has been improved by removing batch-based execution and enabling real-time queue processing.

Benefits include:

- Faster request processing
 - Reduced queue wait times
 - Improved deployment responsiveness
-

EW-2448 – Export “Include Top Member” Field Visibility

Description:

The “Include Top Member” field is now always visible.

If no Top Member is selected, the field remains visible but disabled.

EW-2454 – New Application Property to Control Metadata Deletion

Description:

Added new Application Property:

ALLOW_APPLICATION_DELETE_METADATA

Default Value: Y

This property allows administrators to control whether metadata deletion is permitted independently of full application deletion.

Also fixed issue where Dimension deletion was allowed even when deletion was disabled.

EW-2460 – New API to Cancel or Delete Requests

Description:

Added new API in package EW_REQ_API to allow programmatic cancellation or deletion of requests.

EW-2462 – Metadata Explorer Search Validation

Description:

If a user searches using only *, the system now displays:

Please enter search text.

This prevents unnecessary full metadata scans.

EW-2463 – New Global Setting for Debugging Derived Property Performance

Description:

New Global Setting added:

Debug - Derived Properties in Export Module

Used to assist with performance troubleshooting. Disabled by default.

EW-2465 – Bulk Upload Performance Improvements

Description:

Improved bulk upload logic to prevent repeated processing of failed records.

Previously, failed records were repeatedly reprocessed unnecessarily.

Now, reprocessing stops when no progress is detected, significantly improving performance.

EW-2468 – New API to Retrieve Members by Property Value

Description:

Enhanced API in EW_HIERARCHY package:

Function:

`get_members_having_prop_value`

New optional parameter:

`p_list_or_count`

Allows returning either:

- Member list
- Member count

Supports dimension filtering and wildcard matching.

EW-2476 – Correct Request Line Ordering After Member Move

Description:

Resolved issue where moving newly created members under new parent members caused incorrect request line ordering.

This caused deployment failures in Essbase and OneStream.

Fix:

Request lines are now automatically reordered to ensure parent members appear before child members.
