Release 25.09.99 Notes

Test Release Date: Sep 8th, 2025, **Production Release Date:** Sep 19th, 2025

Agent Update

A OneStream DLL Agent file update is required with this release.

Introduction

EPMware Release 25.09.99

This is a minor release containing new features and enhancements to existing features, and API additions. The features of this release were developed to enhance the design capabilities, performance, and improve ease of use of applications. System administrators and users will benefit from the enhancements across their application.

New Features

EW-2347: Global Setting to Cancel or Delete Related Lines

Users now have the flexibility to delete or cancel **related request lines**.

- Previously, mapped lines could only be deleted by removing the parent request line.
- This new **Global Setting** allows breaking links between source and target dimensions when required.

Improvements

EW-1765: Centralized Logging for SSO Exceptions

All SSO-related exceptions are now stored in a dedicated **SSO Error Log table**, instead of only in Apache logs.

- Accessible via the **SSO Configuration page** or through **Security Group reports**.

- Provides easier troubleshooting for both Cloud and On-Premise customers.
 - Especially useful for customers who periodically update their SSO SAML files.
-

EW-2165: OneStream Deployment – Improved Performance for Large Deployments

The **OneStream DLL** has been optimized to handle large deployments significantly faster.

- Customers will receive updated communications about the enhancement.
 - Updated agent files are now available on EPMware infrastructure.
-

EW-2290: Performance Improvements for Generic Applications

Enhanced processing performance for large deployments of **Generic Applications**.

EW-2322: Deployment Monitor UI Update

On the **Deployment Monitor** page, the **Application** column has been repositioned to display immediately after the **Name** column for improved readability.

EW-2324: Parameterized AWS_KEY for AWS S3 Agent

The AWS S3 agent now retrieves the **AWS_KEY** (subfolder within the bucket) from the **EW_AGENT_PARAMS** table instead of only from **Server Properties**.

- This allows the **AWS_KEY** to be fully parameterized.
-

EW-2326: Configurable Agent Polling Interval for New Servers

Previously, new servers defaulted to sending email notifications every 2 minutes.

- The agent polling interval will now respect the **configured interval** for new servers.
-

EW-2331: Cleaner Report Parameters List

Applications created solely for **environment mapping** are now excluded from the **Reports Parameters List**, as they do not contain metadata.

EW-2338: Server Configuration Pop-Up Enhancements

The **Server Configuration** pop-up has been improved for usability:

- Increased width ensures long labels (e.g., *Agent Polling Interval*) display in a single line.
 - *Required field indicators* remain visible without scrolling.
 - **Test Connection response** can now display beside the button (where feasible).
 - (Optional) **Test Connection button colors**: Green = Success, Red = Failure.
-

EW-2345: Smarter Property Line Creation

An optional parameter has been added to `ew_req_api.create_line_edit_prop`:

- Prevents creation of request lines when the property value provided matches the existing value.

EW-2327: Fixed Width Export Support for Member Properties

Exports created with the **Fixed Width** format now correctly display **member property values**, ensuring consistency across export formats.

EW-2337: Bulk Upload Handling for Parent–Child Deletes

Bulk Upload has been enhanced to handle delete operations more intelligently.

- When a **Parent Member** is deleted, its **Child Members** are automatically removed.
 - Users no longer need to include child members in the upload file, avoiding unnecessary errors.
-

EW-2349: Export Profile – Preserve File Extensions

Improvements made to how **Export Profile file extensions** are managed:

1. **Edit Profile** – File extensions remain unchanged unless the user updates them.
2. **Create Profile** – File extensions are automatically assigned based on selected export format type.
3. **Manual Updates** – If a user manually edits a file extension, it is preserved.

Bug Fixes

EW-2332: Workflow ORA Error in Custom Tasks

Resolved an issue where certain **Workflow executions** threw an **ORA error** while running custom tasks within a stage.

EW-2333: Limited Server List on Properties Page

The **Server Properties** page now displays **all available servers**, not just the first 10.

EW-2334: Agent Polling Defaults Stored Incorrectly

Fixed a bug where default values for **agent_poll_interval** and **agent_no_response_email_template** were being stored even when **Enable Agent Polling** was disabled.

- These fields are now only populated when polling is explicitly enabled.
-

EW-2340: Environment Mapping Screen Stability

Addressed multiple issues in the **Environment Mapping** screen:

- Save confirmation messages now appear correctly.
 - Creating new mappings no longer attempts to re-insert existing records.
 - Renaming mappings no longer causes duplicate entries.
-

EW-2342: Synchronize Hierarchies – Move Member Fix

The **Synchronize Hierarchies** metadata report now processes **Move Member** actions even when the **Previous Sibling** does not match.

- This ensures synchronization continues without errors when sibling order varies between applications.
-

EW-2343: OneStream – Delete Member Behavior Corrected

Fixed an issue in **OneStream Consolidated Dimensions** where deleting a created member line inadvertently removed other shared nodes for that member.

- Deletions now affect only the targeted request line.
-

EW-2344: HFM Redeployment of Renamed Members

Resolved deployment errors when redeploying **renamed members** in HFM applications.

- The system now properly handles the “OldName” tag during redeployment.
-

EW-2348: OneStream – Cancel Rename Issue

Fixed an issue where **renaming and then canceling a member rename** in OneStream did not revert the name correctly in extended dimensions.

EW-2350: Test Connection Aborted by Load Balancer

Resolved an issue where AWS load balancers were aborting **Test Connection requests** after one minute, even while Apache was still processing the request.

- Behavior now aligns with backend expectations.
